# Introduction to Systematic Reviews

**Wednesday 17th April 10:00-15:30 AND Wednesday 24th April 10:00-15:30**

**(Both days are compulsory)**

This two-day course offers an introduction to systematic reviews, including an overview of the key components of systematic reviews. The course is generic to conducting a systematic review of any type; i.e. it is not specific to conducting a specific type of review, such as a Cochrane review, rather the idea is to provide participants with the basic skills necessary to conduct systematic reviews of varying types. Day 1 will provide an overview of different types of reviews, and focus on defining the review question and developing your search and selection strategy for a systematic review. Day 2 will focus on quality appraisal of studies included in a review, data analysis techniques (meta-analysis and meta-synthesis) and presentation of findings.

The course is free of charge . Registration Essential.
